

Cross Site Scripting and Javascript injection

We also tried applying alert to exploit cross site scripting using `<script>alert("hello")</script>` in the post input box. Although no alert popped up, nothing was posted, this showed that the input was not sanitized. We also tried This led us to inserting other scripts and JavaScript injection using the post page. We also tried using `javascript:alert('Executed!');`, this worked and an alert window popped up. This exploit can lead to malicious script source to be inserted into the page.
