Cross Site Request Forgery

Another exploit is CSRF. CSRF can be used to insert an image but the image actually does something else. For example, <img src="http://bank.example.com/withdraw?account=bob&amount=1000000&for=mallory">would create an image however, the image would transfer bank money somewhere else as long as your cookies are still valid.

In the website, I attempted to use CSRF by inserting script into the post box, however the image does not redirect. Instead, I used the following code:

View my Pictures!

This worked, as it created a hyperlink in the post. This allowed other users to click on it, thinking they will view pictures, but instead, it transfers money from their bank account.
